Decibel (dB) level measurements were taken with a hand-held digital sound level meter (Tenma®, Model 72-935) calibrated to manufacturer's specifications. A-weighted scale, set at a slow response time capturing the maximum sound level. 0 inches is equal to a child's ear to the toy. 10 inches is equal to a child's arm length from the toy. Toys were tested at their highest volume setting. To decrease the volume of a noise-producing toy, SHA recommends setting the volume at the lowest setting and then apply clear packing tape over the speaker of the toy.

Sight & Hearing Association – 1430 Concordia Ave #40009, Saint Paul, MN 55104 – 800-992-0424, x11 – kwebb@sightandhearing.org

Celebrating over 80 years of identifying and preventing vision and hearing loss, in partnership with other professional and community organizations by providing screenings, education and research.
